Getting Started with SQL Server CE

SQL CE Implementation Case Study

We spent the beginning of this year on an *Agile Enterprise JumpStart* project building a foundation architecture for a rewrite of a commercial desktop application which required **both** a local disconnected database and an n-tier data services layer.

The original application written in Delphi connected to a local SQL Express database and contained a home brewed synchronization process to a backend database.

We implemented a .NET SmartClient layered and decoupled architecture with data services provided by the **Entity Framework** and IdeaBlade's **DevForce** ORM data services components. Data access logic uses LINQ.

Data services layer connects to **either** the local CE database **or** a middleware server over the web. The local SQL CE database synchronizes with a remote SQL Server Database and uses **Merge Replication** sync services.

After implementation, we handed off the knowledge and reference tools to the development team which continues to refine and complete the application.
